Submitted on 17 Nov 2015

HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

DEFINITION

- A *label* is finite sequence of positive integers. A *labelled formula* is an expression of the form $i\varphi$, where i is the label of the formula φ .
- If the label i is a sequence of length >1 the positive integers of the sequence will be separated by periods. Thus, if i is a label and an n is positive integer, then $i.n$ is a new label, called *an extension of i* . The label i is then an *initial segment* of $i.n$.

<i>Restricted Labelling</i>	Unrestricted Labelling
$(\mathbf{V})\Box A_i$ ----- $(\mathbf{V})A_j$ $(\mathbf{F})\Diamond A_i$ ----- $(\mathbf{F})A_j$	$(\mathbf{F})\Box A_i$ ----- $(\mathbf{F})A_j$ $(\mathbf{T})\Diamond A_i$ ----- $(\mathbf{T})A_j$

Tableaux and as generated by winning strategies

- If Σ is a set of dialogically signed formulae and X is a single dialogically signed formula, we will write Σ, X for $\Sigma \cup \{X\}$.
- Observe that the formulae below the line always represent pairs of attack and defence moves. In other words, they represent rounds.
- The vertical bar '|' indicates alternative choices for \mathbf{O} , \mathbf{P} 's strategy must have a defence for both possibilities (dialogical games defining two possible plays).
- The rules containing yielding two lines indicate that it is \mathbf{P} who has the choice – an he thus might need only one of both possible choices.
- Note that the expressions between the symbols "<" and ">", such as $\langle(\mathbf{P})?\rangle$ or $\langle(\mathbf{O})?\rangle$ are moves – more precisely they are attacks – but not formulae (assertions) which could be attacked. These expressions are not actually part of the tableau. They are formulae which are included in the set of formulae. **These expressions are rather part of the algorithmic device to reconstruct the correspondent dialogues.**

Intuitionistic Tableaux

(\mathbf{O})-Cases	(\mathbf{P})-Cases
$\Sigma, (\mathbf{O})A \vee B$ ----- $\Sigma, \langle(\mathbf{P})?\text{-}\vee\rangle(\mathbf{O})A \mid \Sigma, \langle(\mathbf{P})?\text{-}\vee\rangle(\mathbf{O})B$	$\Sigma, (\mathbf{P})A \vee B$ ----- $\Sigma_{[\mathbf{O}]}, \langle(\mathbf{O})?\text{-}\vee\rangle(\mathbf{P})A$ $\Sigma_{[\mathbf{O}]}, \langle(\mathbf{O})?\text{-}\vee\rangle(\mathbf{P})B$
$\Sigma, (\mathbf{O})A \wedge B$ ----- $\Sigma, \langle(\mathbf{P})?\text{-}L\rangle(\mathbf{O})A$ $\Sigma, \langle(\mathbf{P})?\text{-}R\rangle(\mathbf{O})B$	$\Sigma, (\mathbf{P})A \wedge B$ ----- $\Sigma_{[\mathbf{O}]}, \langle(\mathbf{O})?\text{-}L\rangle(\mathbf{P})A \mid \Sigma_{[\mathbf{O}]}, \langle(\mathbf{O})?\text{-}R\rangle(\mathbf{P})B$
$\Sigma, (\mathbf{O})A \rightarrow B$ ----- $\Sigma_{[\mathbf{O}]}, (\mathbf{P})A \dots \mid \langle(\mathbf{P})A\rangle(\mathbf{O})B$	$\Sigma, (\mathbf{P})A \rightarrow B$ ----- $\Sigma_{[\mathbf{O}]}, (\mathbf{O})A; (\mathbf{P})B$
$\Sigma, (\mathbf{O})\neg A$ ----- $\Sigma_{[\mathbf{O}]}, (\mathbf{P})A; \text{---}$	$\Sigma, (\mathbf{P})\neg A$ ----- $\Sigma_{[\mathbf{O}]}, (\mathbf{O})A; \text{---}$
$\Sigma, (\mathbf{O})\forall xA$ ----- $\Sigma, \langle(\mathbf{P})?\text{-}\forall x/k_i\rangle(\mathbf{O})A_{[x/k_i]}$	$\Sigma, (\mathbf{P})\forall xA$ ----- $\Sigma_{[\mathbf{O}]}, \langle(\mathbf{O})?\text{-}\forall x/k_i\rangle(\mathbf{P})A_{[x/k_i]}$

$$\begin{array}{c}
\frac{\Sigma, (\mathbf{O})\exists xA}{\Sigma, \langle (\mathbf{P})?-\exists \rangle (\mathbf{O})A_{[x/ki]} \\
k_i \text{ is new}}
\end{array}
\quad \Bigg| \quad
\begin{array}{c}
\frac{k_i \text{ is new}}{\Sigma, (\mathbf{P})\exists xA} \\
\frac{\Sigma_{[\mathbf{O}]}, \langle (\mathbf{O})?-\exists \rangle (\mathbf{P})A_{[x/ki]}
\end{array}$$

Intuitionistic tableaux are generated with the addition of the set $\Sigma_{[\mathbf{O}]}$. which only contains O-signed formulae): the totality of the previous **P**-formulae on the same branch of the tree are eliminated.

DEFINITION

Let us look at two examples, namely one for classical logic and one for intuitionistic logic. We use the tree shape of the tableau made popular by Smullyan ([18]):

If Θ is a given set of (**P**-, or **O**-) signed formulae, we say one of the rules **R** of above rules of the tableaux-system *applies* to Θ if by appropriate choice of Θ , the collection of signed formulae above the line in rule **R** becomes Θ .

By an *application of **R** to the set Θ* , we mean the replacement of Θ by Θ_1 (or by Θ_1 and Θ_2 , if **R** is (**P**) \wedge , (**O**) \vee , or (**O**) \rightarrow) where Θ is the set of formulae above the line in rule **R** (after suitable substitution for Σ , and for the formulae **A** (and **B**)) and Θ_1 (or Θ_1 and Θ_2) is the set of formulae below. This assumes **R** to apply to Θ . Otherwise the result is again Θ . For example, by applying rule (**P**) \rightarrow to the set Θ : $\{(\mathbf{O})\mathbf{A}, (\mathbf{P})\mathbf{B}, (\mathbf{P})(\mathbf{C}\rightarrow\mathbf{D})\}$ we may get $\Sigma_{[\mathbf{O}]}4\Theta_1$: $\{(\mathbf{O})\mathbf{A}, (\mathbf{O})\mathbf{C}, (\mathbf{P})\mathbf{D}\}$ – notice that (**P**)**B** disappeared because we have $\Sigma_{[\mathbf{O}]}$ and not Σ .

By *configuration* we mean a finite collection $\{\Sigma_1, \Sigma_2, \dots, \Sigma_n\}$ of sets of signed formulae, where Σ might stand for Σ and/or $\Sigma_{[\mathbf{O}]}$.

By an *application of **R** to the configuration $\{\Sigma_1, \Sigma_2, \dots, \Sigma_n\}$* we mean the replacement of this configuration with a new one which is like the first except for containing instead of some Σ_i the result (or results) of applying rule **R** to Σ_i .

By a tableau we mean a finite sequence of configurations $\mathfrak{C}_1, \mathfrak{C}_2, \dots, \mathfrak{C}_n$ in which each configuration except the first is the result of applying one of the above rules to the preceding configuration.

A set of signed formulae is closed if it contains both $(\mathbf{O})a$ and $(\mathbf{P})a$ (for a atomic). A configuration $\{\Sigma_1, (\Sigma_2, \dots, \Sigma_n)\}$ is closed if each Σ_i is closed. A tableau $\mathfrak{C}_1, \mathfrak{C}_2, \dots, \mathfrak{C}_n$ is closed if some \mathfrak{C}_i is closed.

By a tableau for a set Σ of signed formulae we mean a tableau $\mathfrak{C}_1, \mathfrak{C}_2, \dots, \mathfrak{C}_n$ in which \mathfrak{C}_1 is $\{\Sigma\}$.

Modal Logic

<i>Restricted Labelling</i>	<i>Unrestricted Labelling</i>
$(\mathbf{O})\Box A_i$ ----- $\langle (\mathbf{P}) ?j \rangle (\mathbf{O})A_j$ $(\mathbf{P}) \Diamond A_i$ ----- $\langle (\mathbf{O}) ? \Diamond \rangle (\mathbf{P})A_j$	$(\mathbf{P})\Box A_i$ ----- $\langle (\mathbf{O}) ?j \rangle (\mathbf{P})A_j$ $(\mathbf{O}) \Diamond A_i$ ----- $\langle (\mathbf{P}) ? \Diamond \rangle (\mathbf{O})A_j$
<p>K: j must occur already in the branch</p> <p>Reflexivity: $j=i$</p> <p>Seriality: j can be new</p> <p>Symmetry: Assume that $i = k.n$, then $j= k$ ($k.n$. is an immediate extension of k, and k occurs already in the branch).</p> <p>Transitivity: i is an initial segment of j (such as $j = i.m$ or $j = i.m.n\dots$).</p> <p>Euclideanity: If in the branch occur, $i, i.n$ and it is the case that $(\mathbf{O})\Box A_i.m$ (or $(\mathbf{P}) \Diamond A_i.m$), then $j = i.n$:</p>	<p>j: is new</p>
