HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Abstract

This paper studies the effects of income, education and active memberships in voluntary organizations and clubs on “social capital” by using individual French data and allowing for parameter heterogeneity (Durlauf and Fafchamps, 2003). Survey responses to the questions concerning trust, social norms and individual involvement in the local life are used as proxies of social capital. The model developed in this paper is an Artificial Neural Network model or more precisely the Neuro-Coefficient Smooth Transition Auto-Regressive (NCSTAR) model. It gives a vector of estimates for every observation of the dataset as a nonlinear function of its geographical position and its individual attributes. We show that accounting for parameter heterogeneity considerably improves the fit of the estimated model in comparison with the broadly used multinomial logit model. Our results suggest empirical evidences of significant positive direct and indirect effects of active membership in voluntary organizations on trust (or rather trustworthiness, Glaeser et al, 2000) and individual’s involvement in his or her community’s life. This finding supports the considering of membership in voluntary organizations in France as promoting the values of cooperation and positive tendency towards public issues. However, the studied relationships are not stable across French departments and some regional patterns are detected.

JEL classification: C12, C22.

Keywords: Social capital, Parameter heterogeneity, Neural network models.

*The data used in this paper were documented and made available by the ZENTRALARCHIV FUER EMPIRISCHE SOZIALFORSCHUNG KOELN. The data for the ISSP “Social Network II” were collected by independent institutions. Principal investigators in France are Michel Forsé and Yannick Lemel. We thank the “Banque de Données Socio-Politiques” for providing us data. Further, the authors thank Jean-Benoît Zimmermann, Anne Peguin-Feissolle, and an anonymous referee for useful suggestions and comments.
