HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Scientific question: The Grotte aux Points shows Upper Palaeolithic wall paintings and drawings in the cave, and an archaeological sequence with cohesive coloring materials.

Were the cohesive colouring materials used to produce rock art in the cave?

Because of the petrographic information loss during pigment processing, geochemistry is the way to investigate this possible link. However this connection can be tricky to establish because of environmental input in applied pigment geochemical fingerprint.

Methodological development:

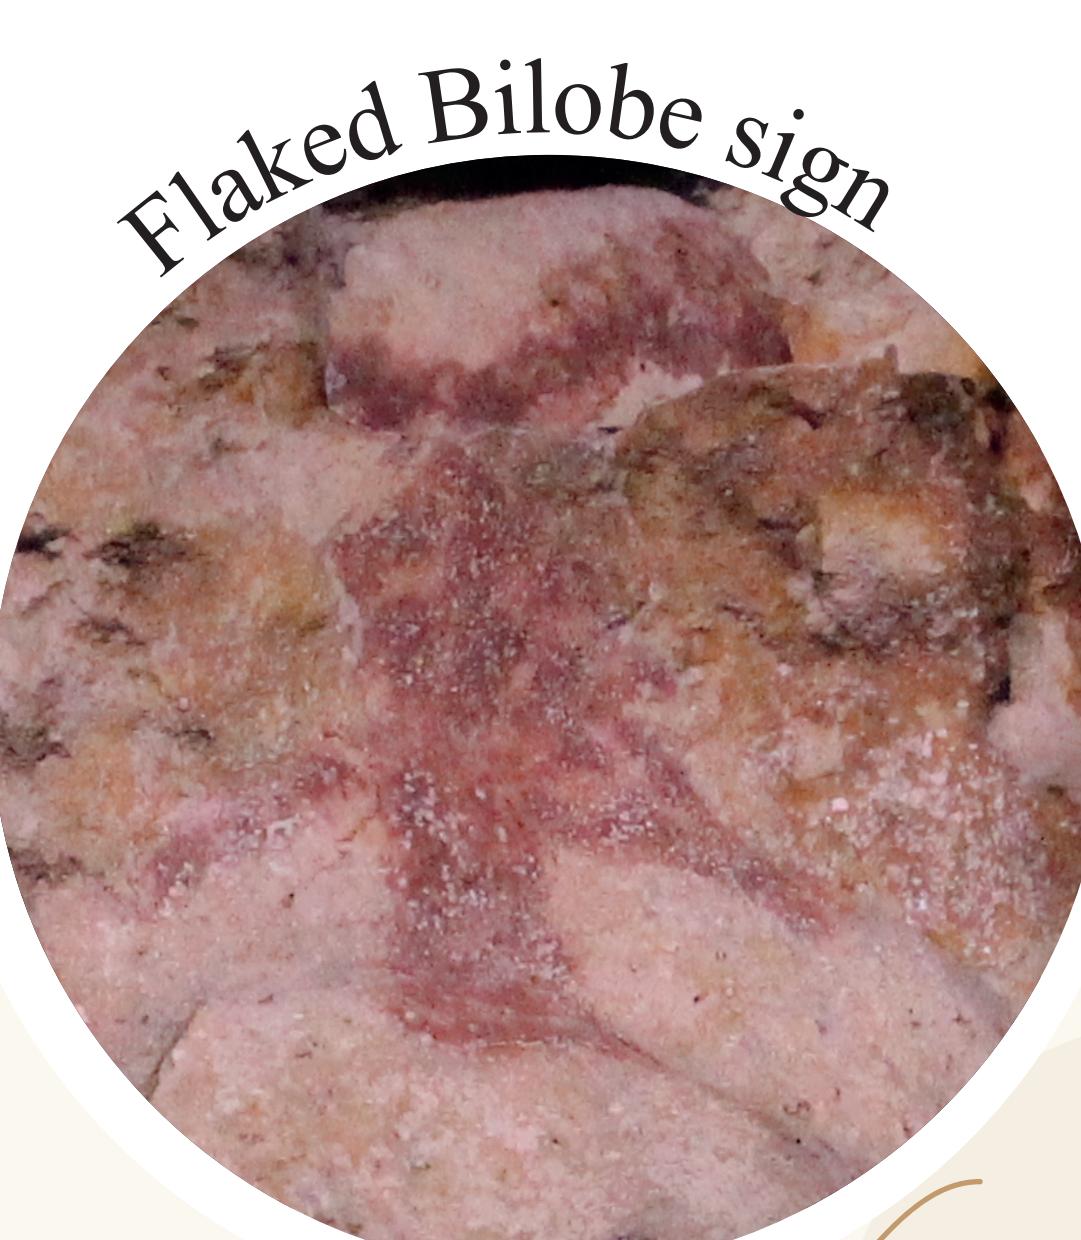

Is it possible to identify a **common** geochemical fingerprint of **raw colouring materials** and applied **pigments** on the walls ?

Method:

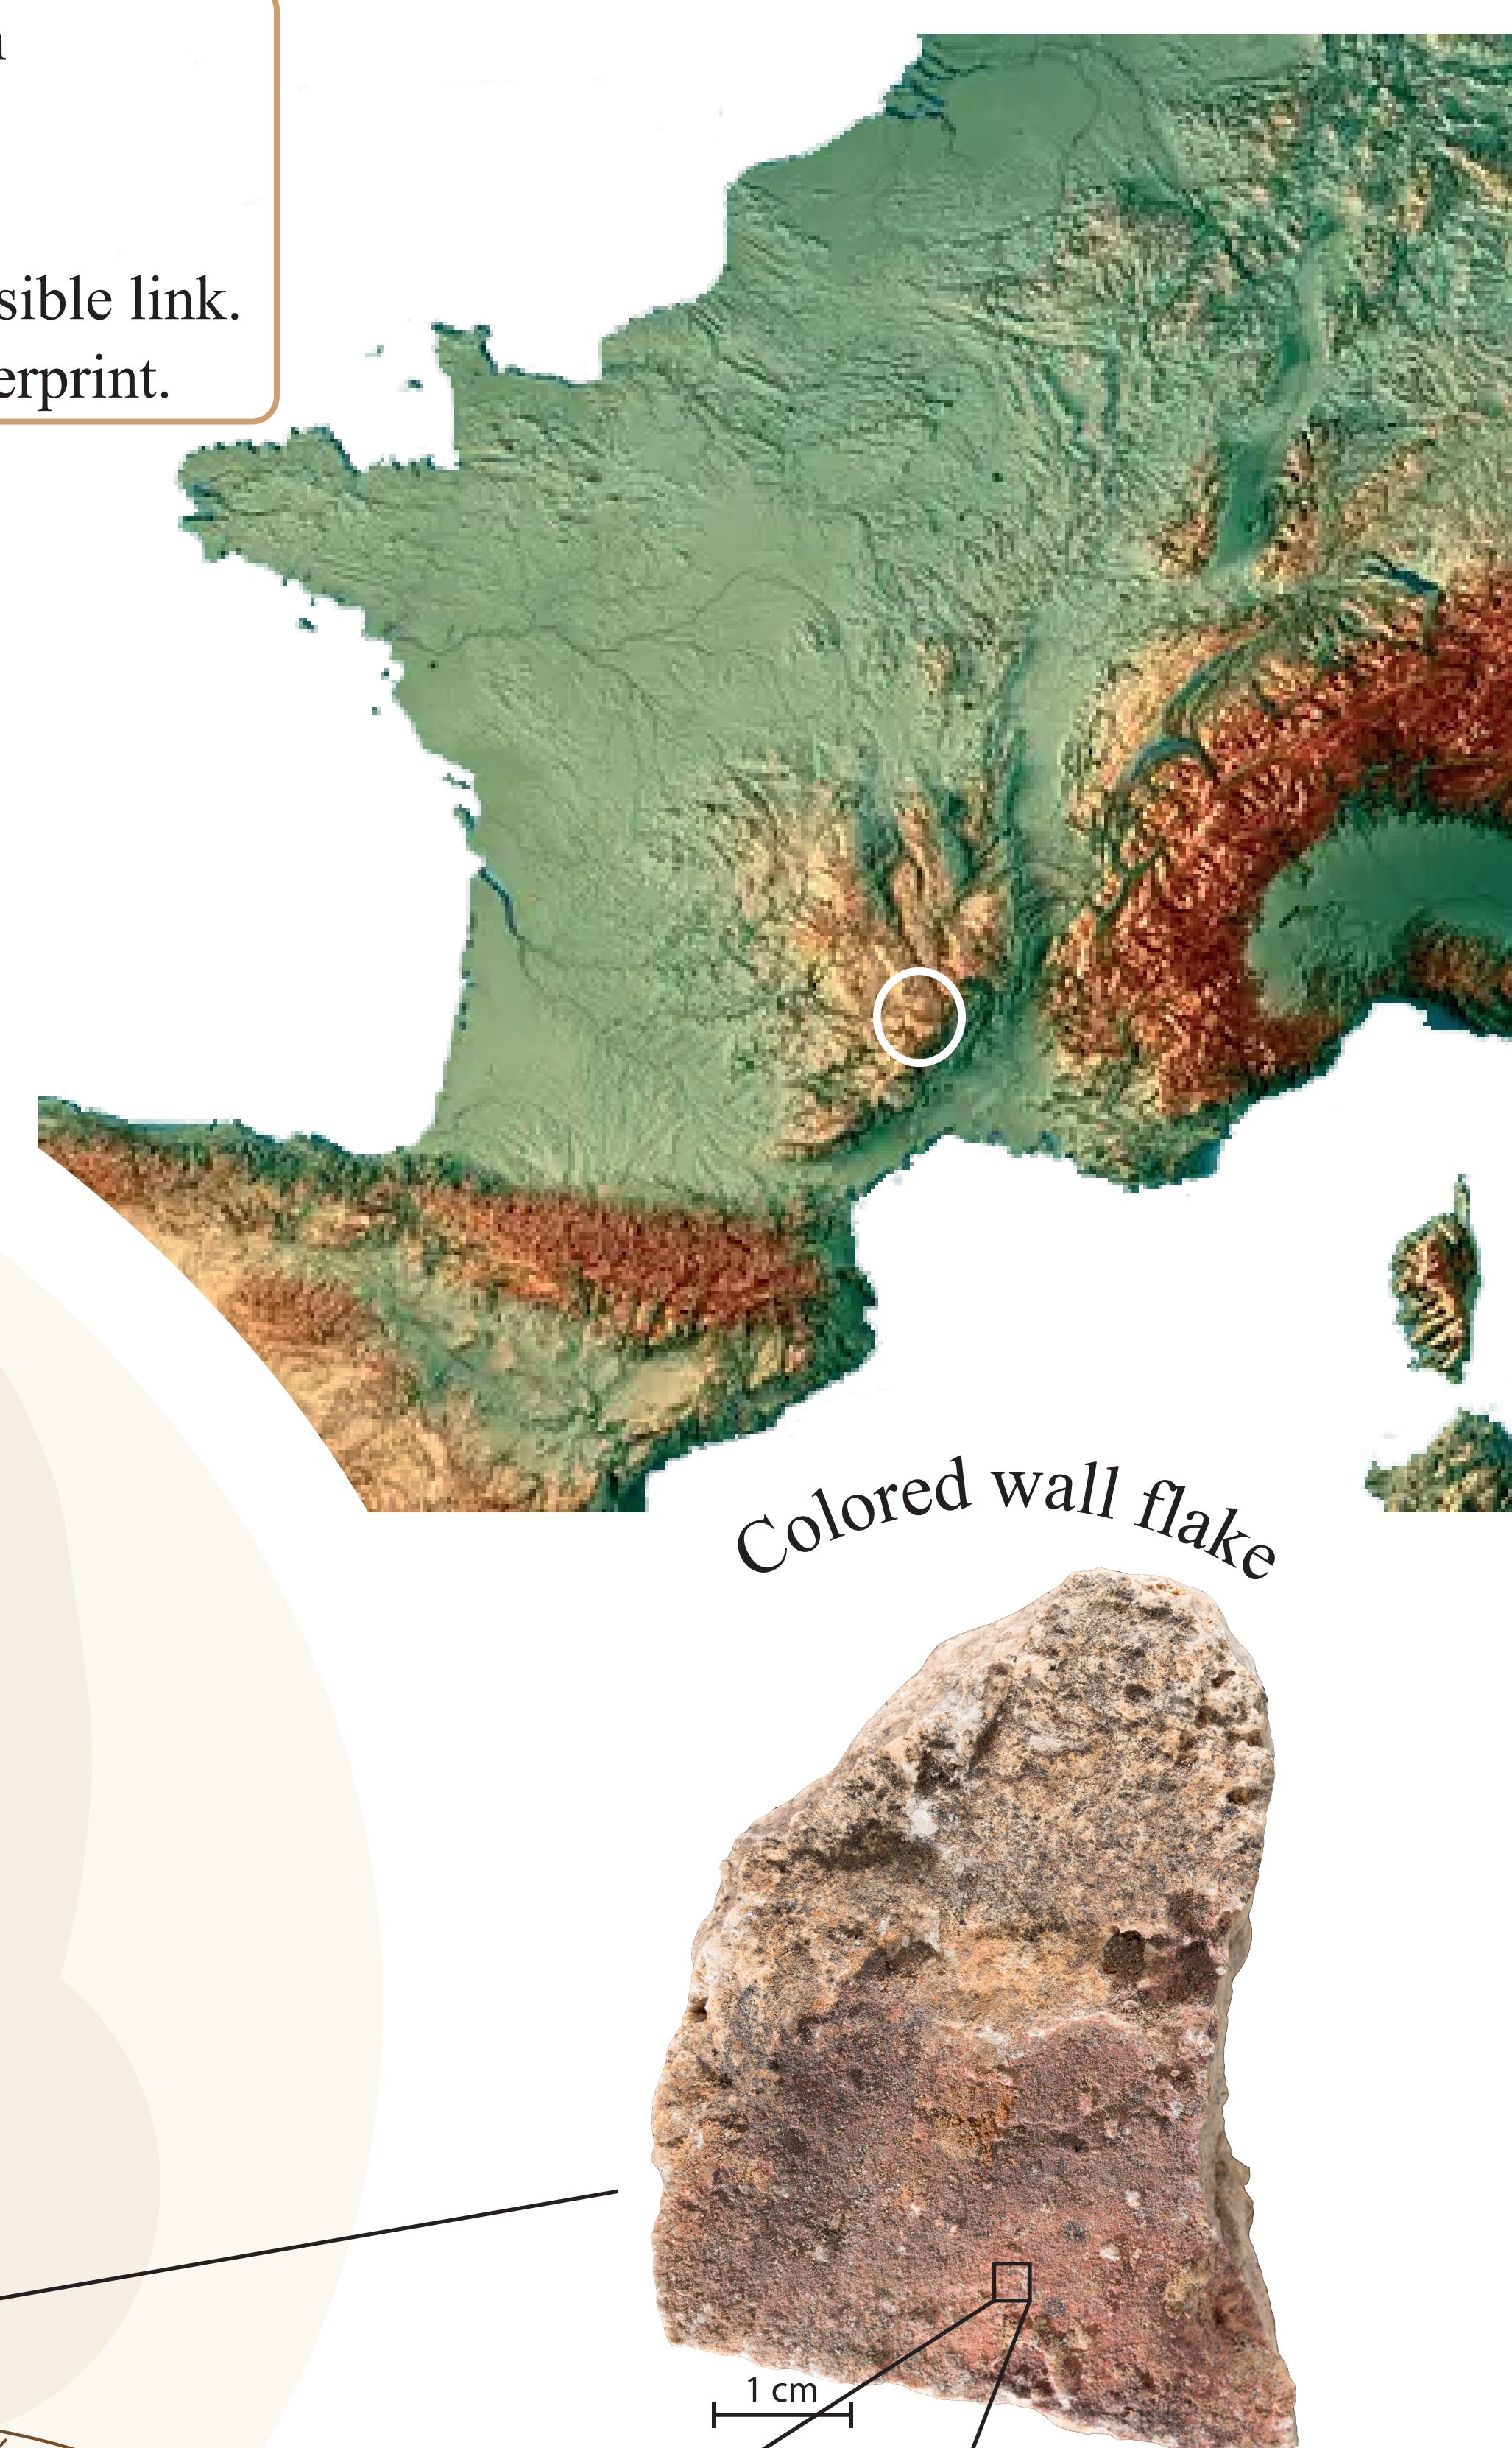

PIXE: External Induced Ion beam X ray fluorescence (geochemical surface mapping with a 10 μm beam)

Iron rich Pixel selection - elemental quantification extraction

Data treatment and analysis (multivariate statistics)

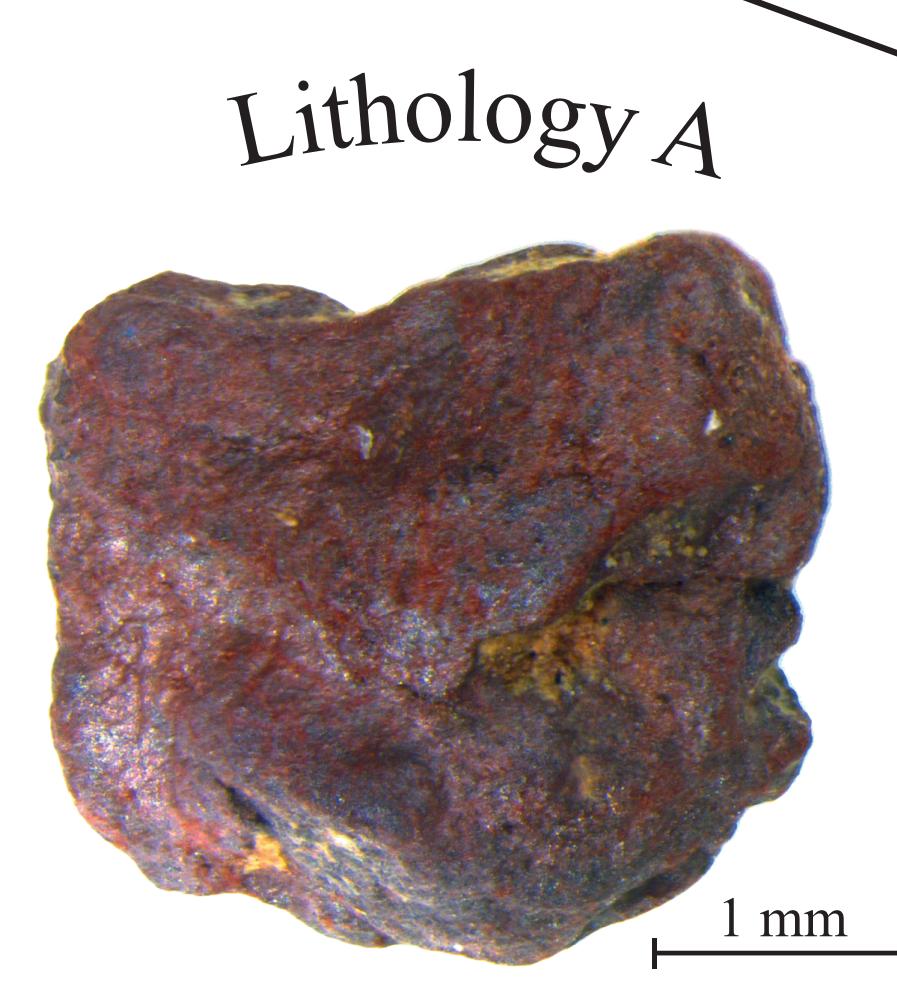

Cave art

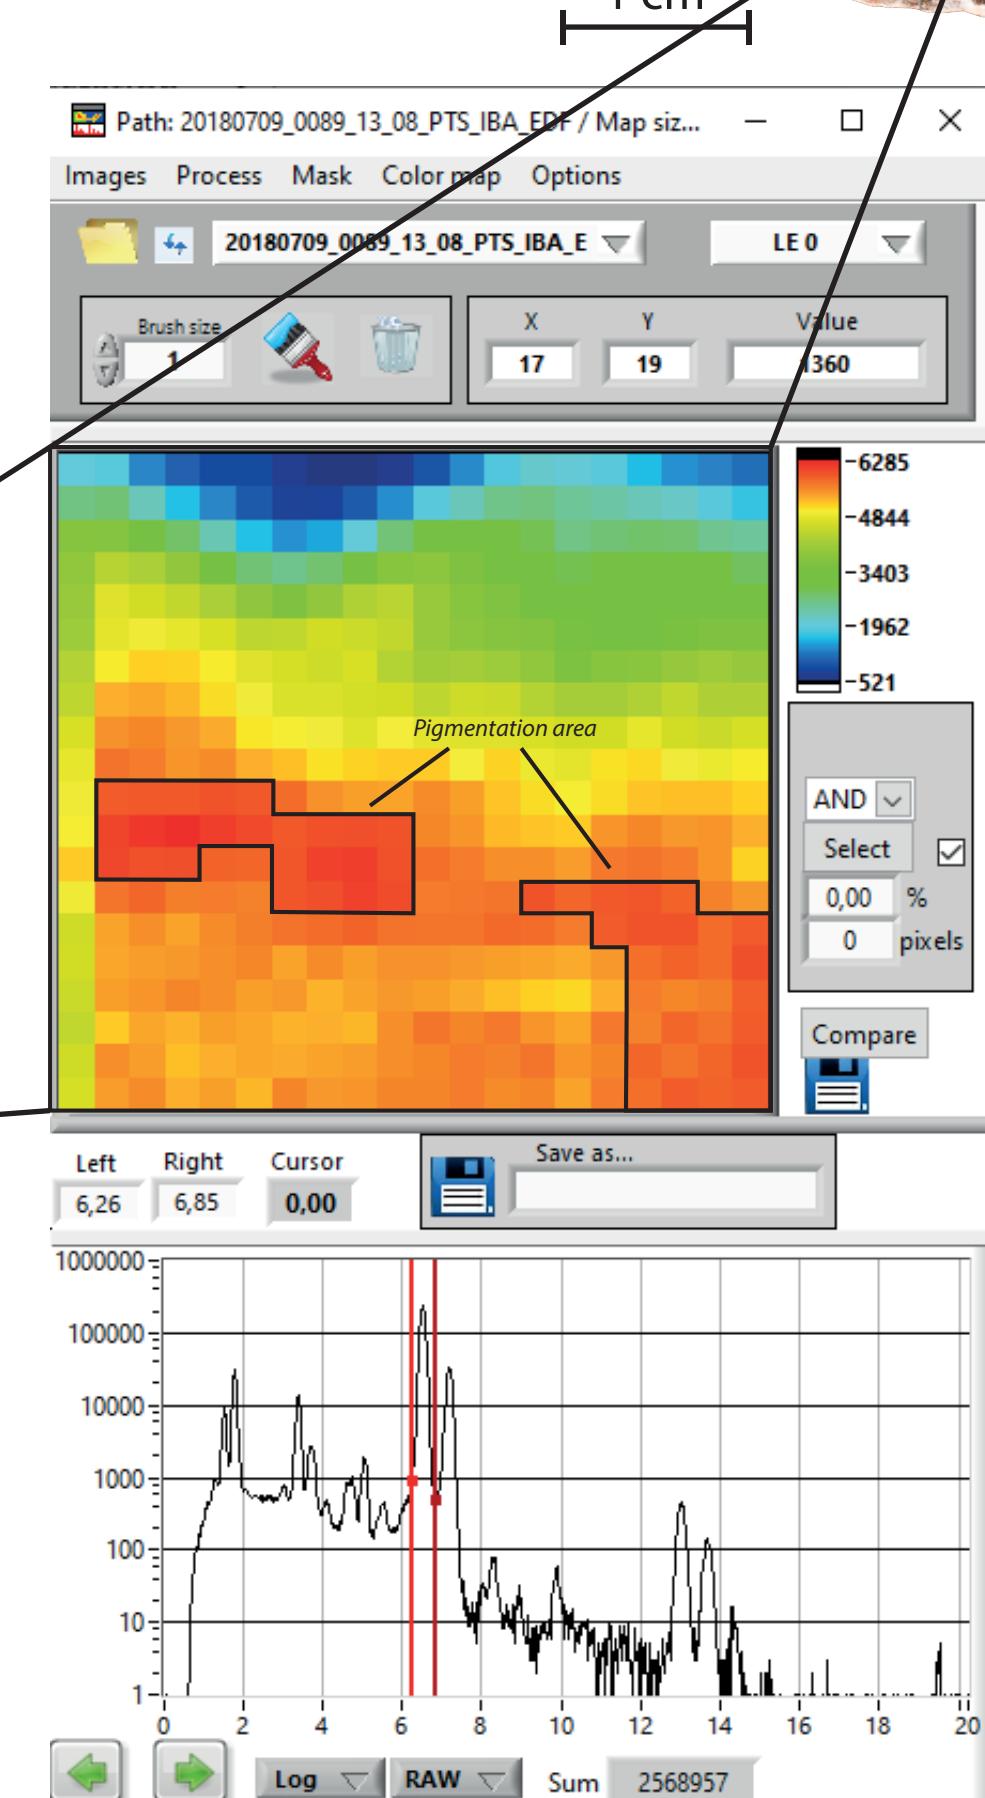

Relation?

Confusion matrix

	PTS-C	PTS-A	PTS-E	Residue	Colored Flakes	Total
PTS-C	7	0	0	0	9	7
PTS-A	0	59	4	24	0	87
PTS-E	0	3	7	0	0	10
Residue	0	6	0	4	0	10
Colored Flakes	0	3	0	1	3	7
Total	7	71	11	29	3	121

Conclusion:

- Strong impact of the environmental input on wall flakes - difficulty to separate the pigment (Fe) and substrate (Ca) fingerprint even though the pixel rich in iron of the map are selected

- High Fe signal difference between colored wall flakes and raw colouring material fragment.

- Possible impact of opal coating on the walls.
