Computational Approach of Musical Orchestration

Constrained Multiobjective Optimization of Sound Combinations in Large Instrument Sample Databases

December 16th, 2008

Grégoire Carpentier - Ph.D. Defense
IRCAM - Music Representation Group

Supervisors : Gérard Assayag (IRCAM) & Emmanuel Saint-James (LIP6)

Timbre similarity (2)

- Hypothesis: Sound combination feature set can be predicted from the values of components features

Timbre similarity (2)

- Hypothesis: Sound combination feature set can be predicted from the values of components features

$\mathcal{S}$

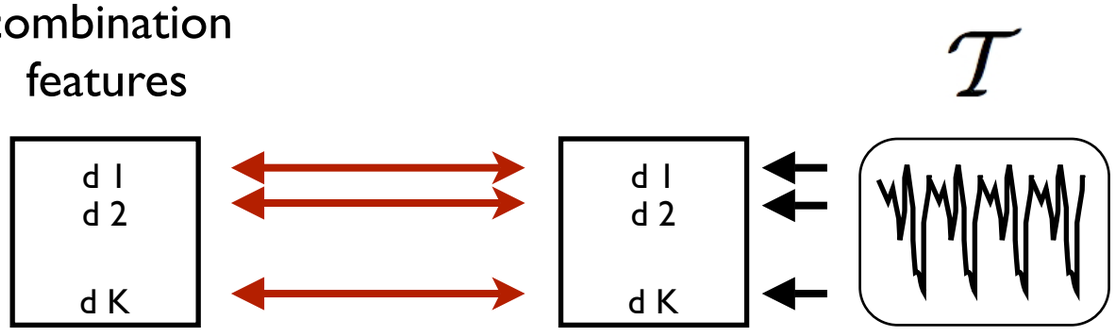
Prediction of combination features



$\mathcal{T}$

Dissimilarity measures along each perceptual dimension

$$\left\{ D_{\mathcal{T}}^{k}(\mathcal{S}) \mid k = 1, \ldots, K \right\}$$

Sound features

- Spectral centroid (brightness) [McAdams+1995]
- Spectral spread (volume) [Chiasson2007]
- Resolved partials (harmonic tone)

- Time and noise features are not considered

- Preliminary tasks:
  - Sound combinations features prediction functions
  - Perceptual dissimilarity functions $\left\{D_T^k(\mathcal{S}) \mid k = 1, \ldots, K\right\}$

Multiobjective approach

Multiobjective approach

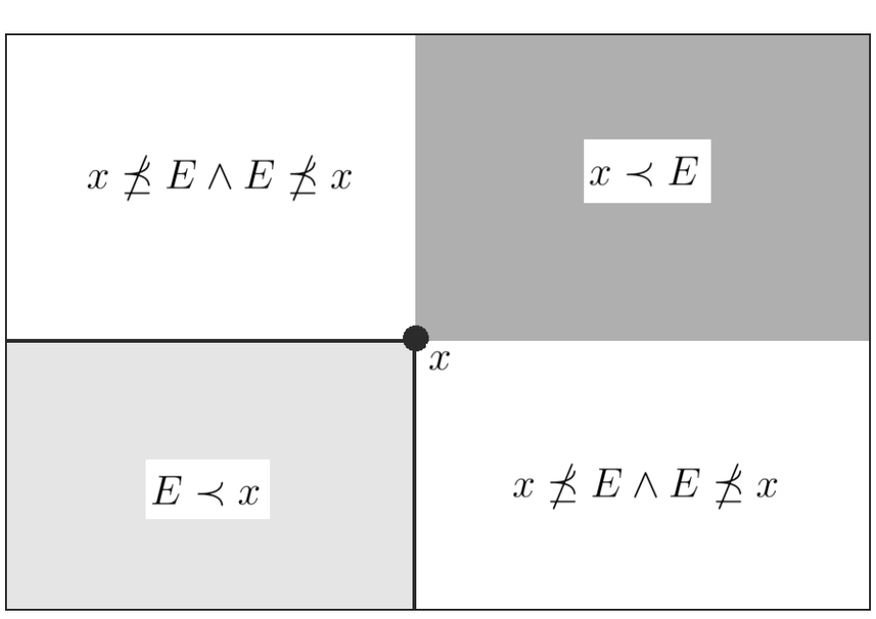
- Relative importance of perceptual dimensions cannot be known without prior information on listening preferences

Multiobjective approach

- Relative importance of perceptual dimensions cannot be known without prior information on listening preferences
- Multiobjective optimization: Jointly minimize $\left\{D_T^k(\mathcal{S}) \mid k = 1, \ldots, K\right\}$

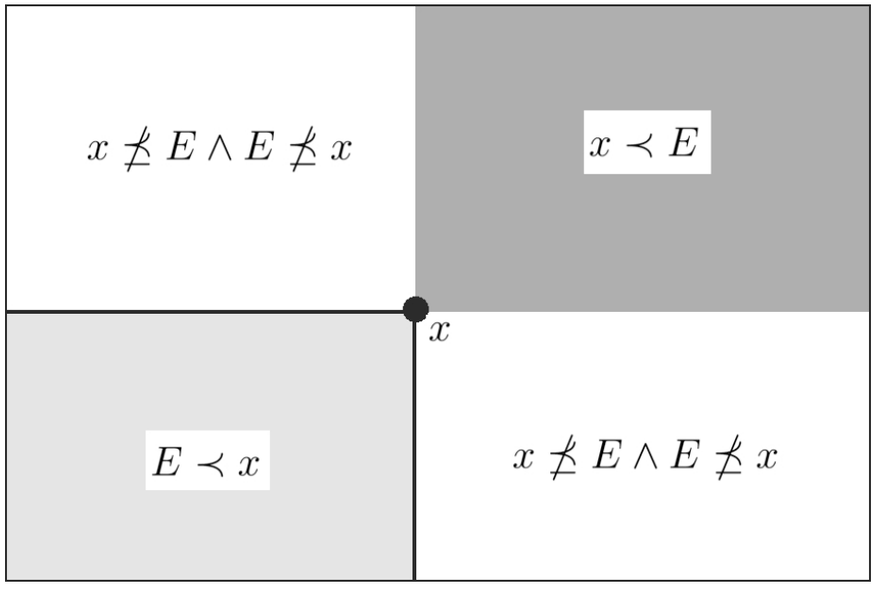
Multiobjective approach

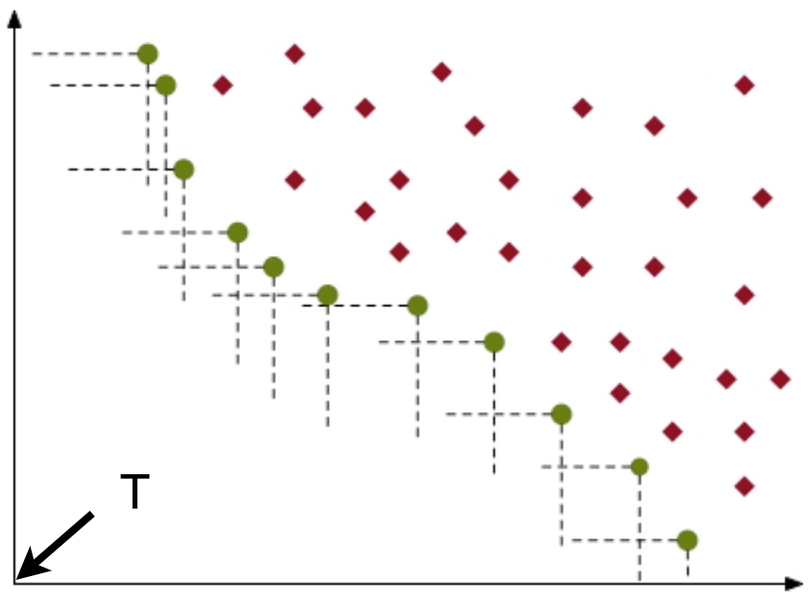
- Relative importance of perceptual dimensions cannot be known without prior information on listening preferences
- Multiobjective optimization: Jointly minimize $\left\{D_T^k(\mathcal{S}) \mid k = 1, \ldots, K\right\}$
- Pareto dominance: $x \preceq y \quad \Leftrightarrow \quad \forall k,\ x_k \leq y_k$



Multiobjective approach

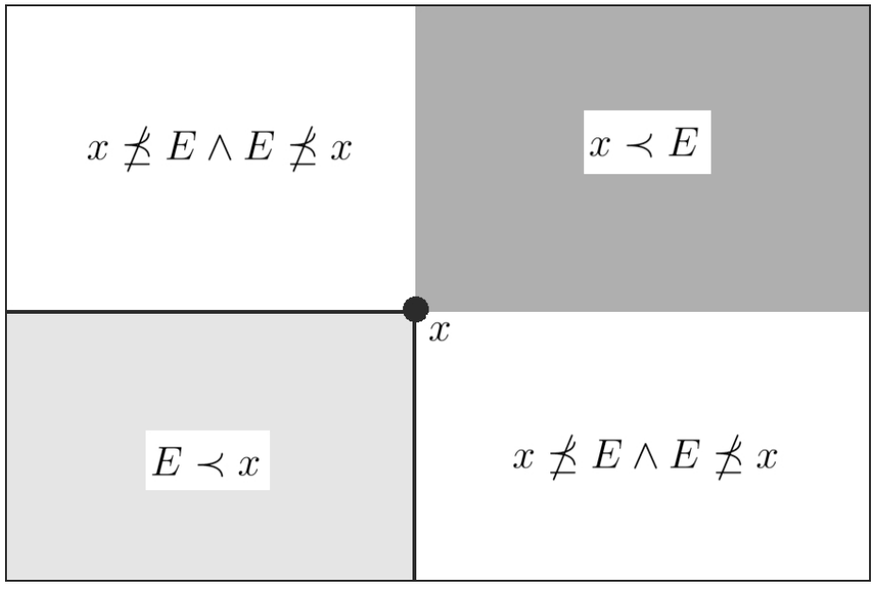
- Relative importance of perceptual dimensions cannot be known without prior information on listening preferences
- Multiobjective optimization: Jointly minimize $\left\{D_T^k(\mathcal{S}) \mid k = 1, \ldots, K\right\}$
- Pareto dominance: $\mathcal{S}_1 \preceq \mathcal{S}_2 \quad \Leftrightarrow \quad \forall k,\ D_T^k(\mathcal{S}_1) \leq D_T^k(\mathcal{S}_2)$

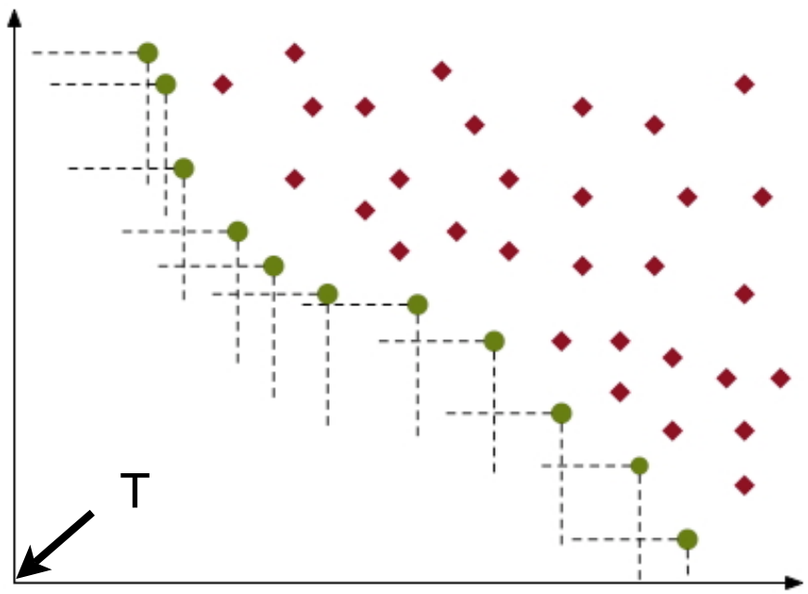




Multiobjective approach

- Relative importance of perceptual dimensions cannot be known without prior information on listening preferences
- Multiobjective optimization: Jointly minimize $\left\{D_T^k(\mathcal{S}) \mid k = 1, \ldots, K\right\}$
- Pareto dominance: $\mathcal{S}_1 \preceq \mathcal{S}_2 \quad \Leftrightarrow \quad \forall k,\ D_T^k(\mathcal{S}_1) \leq D_T^k(\mathcal{S}_2)$





- Set of optimal solutions (implicitly corresponding to different listening preferences)

Formalizing the optimization problem

Formalizing the optimization problem

- Orchestra composed of $\mathcal{I}$ instruments: $\mathcal{I}$ variables problem

Formalizing the optimization problem

- Orchestra composed of $\mathcal{I}$ instruments: $\mathcal{I}$ variables problem
- Domain of each variable: $\bar{E}_i = E_i \cup \{e\}$

Formalizing the optimization problem

- Orchestra composed of $\mathcal{I}$ instruments: $\mathcal{I}$ variables problem
- Domain of each variable: $\bar{E}_i = E_i \cup \{e\}$
- Problem:

$$\begin{cases} \min\limits_{\mathcal{S}} D_T^k(\mathcal{S}) = D_T^k(i_1, \ldots, i_{\mathcal{I}}) \ , \ k \in \{1, \ldots, K\} \\ \text{s.t. } \mathcal{S} \in \{\bar{E}_1 \times \cdots \times \bar{E}_{\mathcal{I}}\} \end{cases} \qquad (P)$$

A NP-hard problem

A NP-hard problem

Consider a 5000 sample sound database. Consider an 11 instruments orchestra in which only 4 can play simultaneously a given 4-note chord. Thus:

A NP-hard problem

Consider a 5000 sample sound database. Consider an 11 instruments orchestra in which only 4 can play simultaneously a given 4-note chord. Thus:

- There are around a billon a feasible combinations

A NP-hard problem

Consider a 5000 sample sound database. Consider an 11 instruments orchestra in which only 4 can play simultaneously a given 4-note chord. Thus:

- There are around a billon a feasible combinations
- Computing their features takes around 20 minutes with 3 perceptual dimensions

A NP-hard problem

3. There is a priority variable to change [Codognet2002]. Decision rule is based on a *min-conflict* heuristic.

1 move heuristic:

4. In the current neighborhood choose the configuration that minimizes the global cost function (*min-conflict*).

1 cycle handling heuristic:

5. Handle cycles and local minima with a short term memory scheme (tabu list [Glover1997])

Combining *orchidée* and *cdcsolver*

Combining *orchidée* and *cdcsolver*

- Genetic algorithms are not well suited for constrained problems

Combining *orchidée* and *cdcsolver*

- Genetic algorithms are not well suited for constrained problems
- Repairing every inconsistent configuration is inefficient

Combining *orchidée* and *cdcsolver*

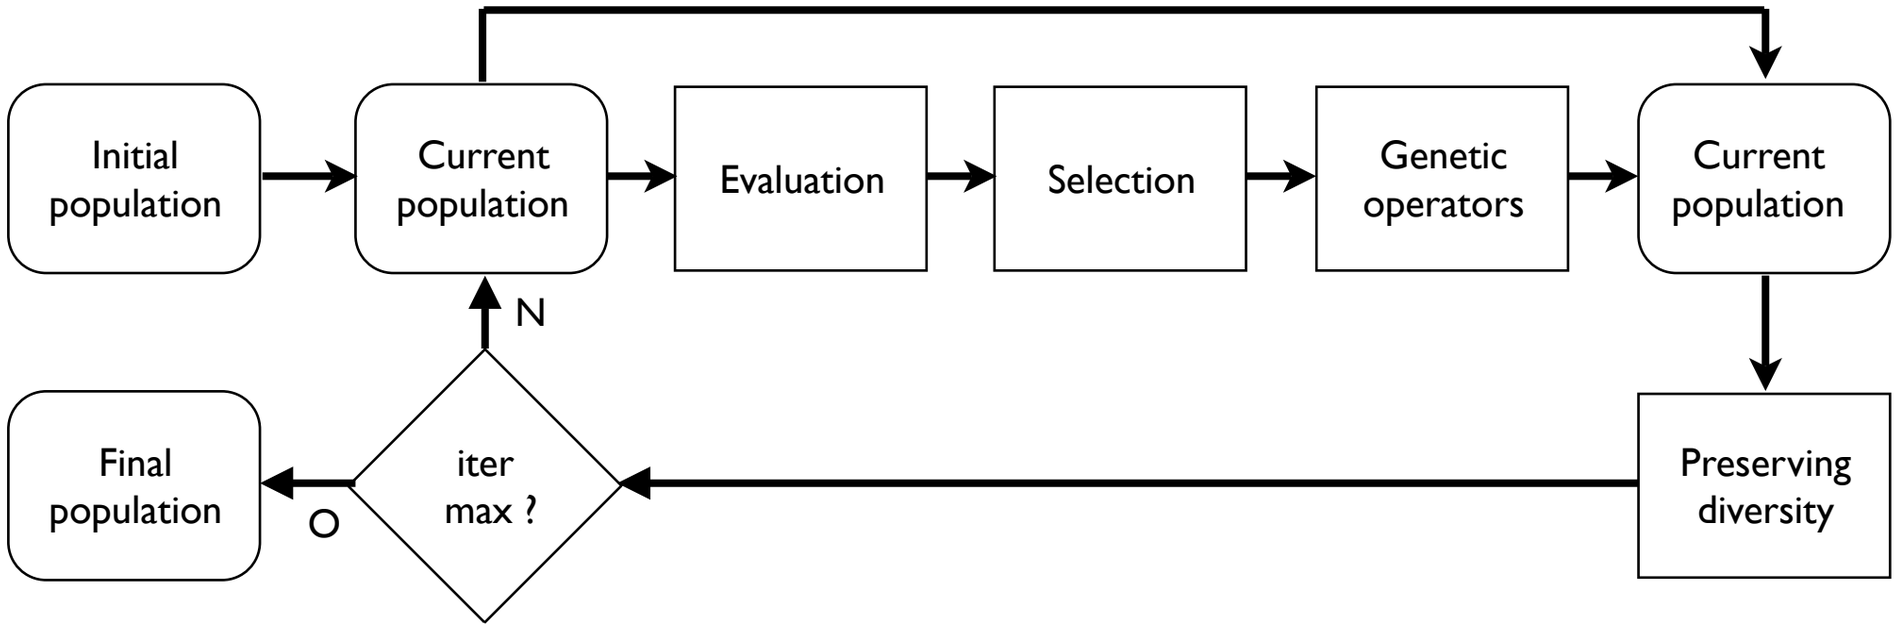
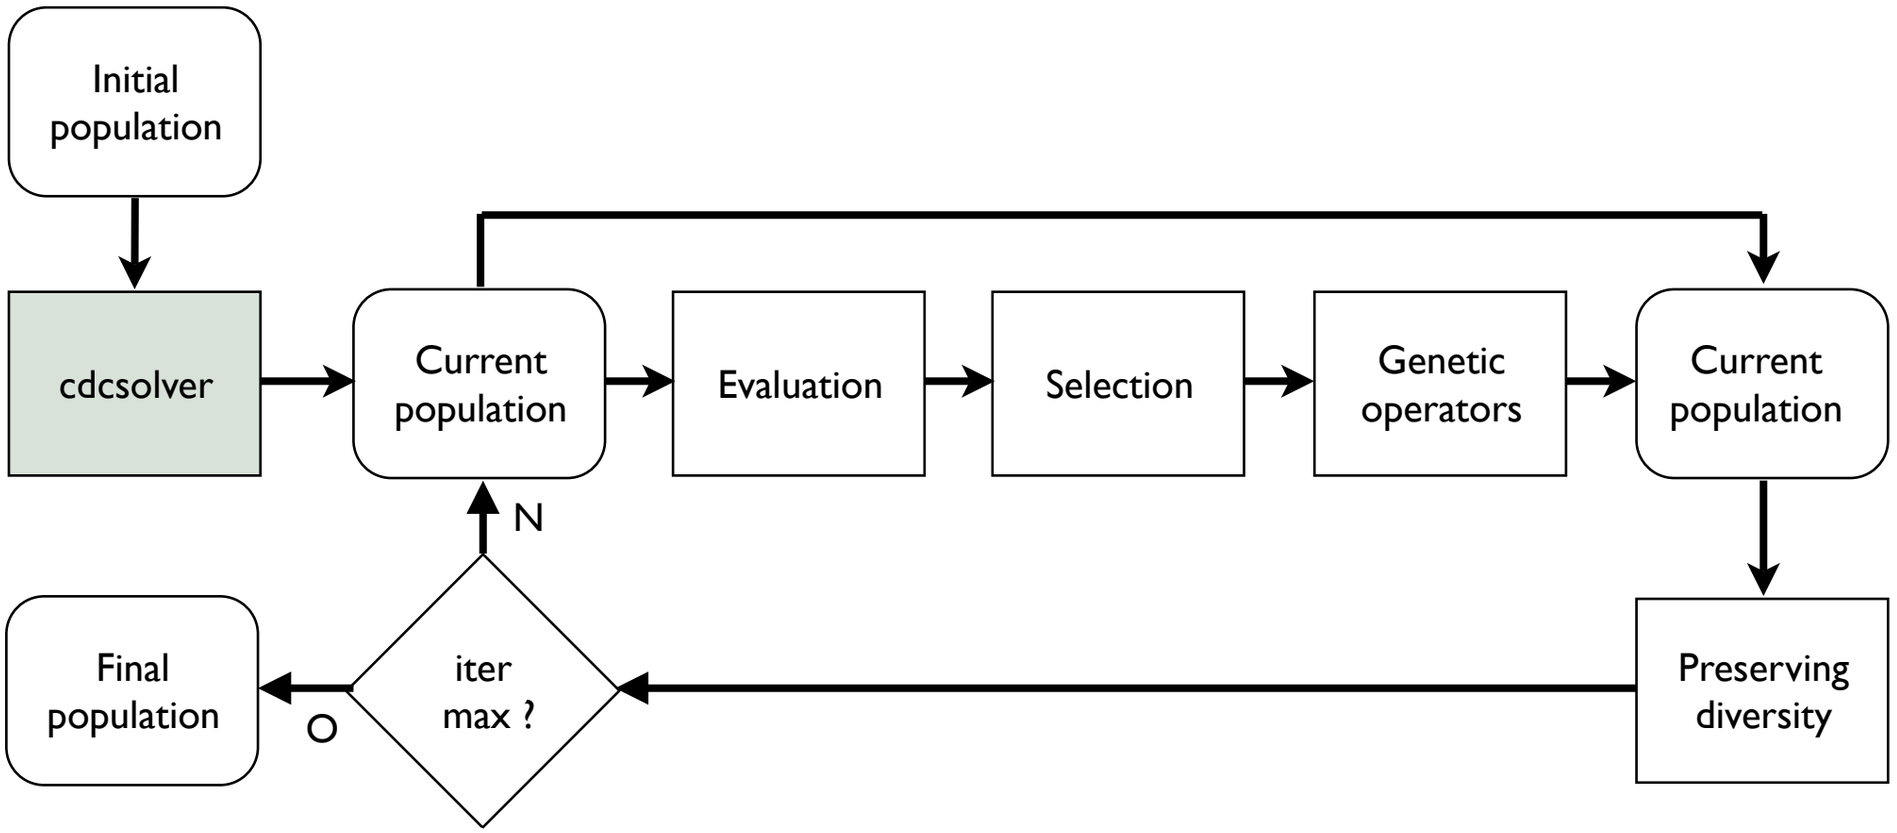
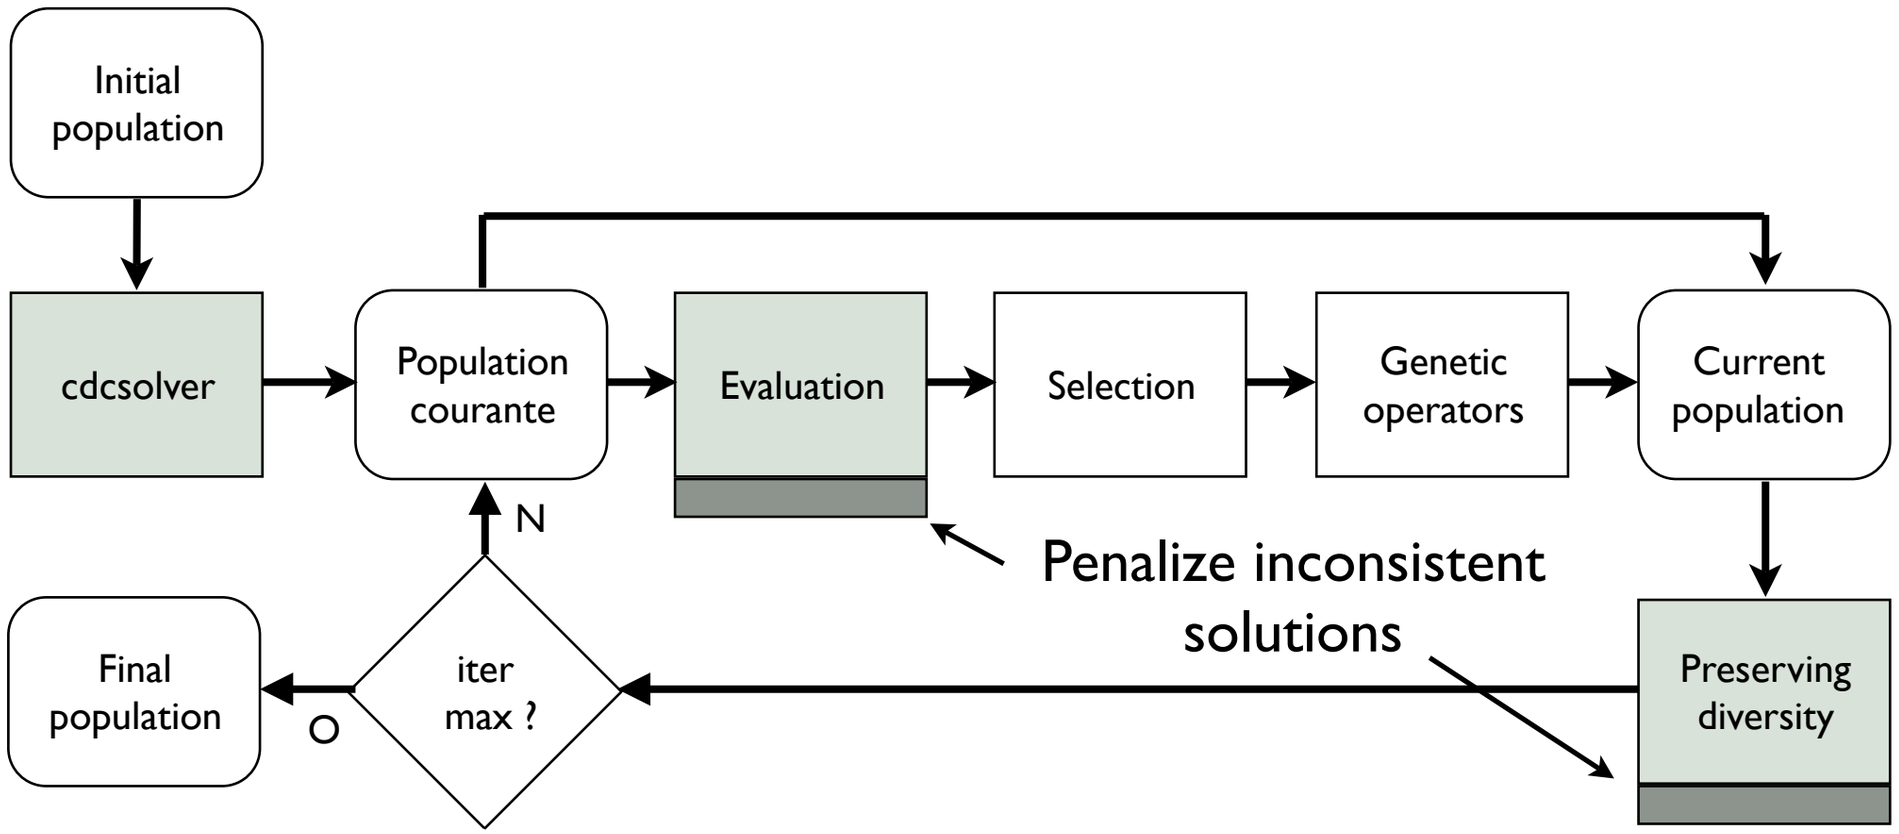
- Repairing every inconsistent configuration is inefficient



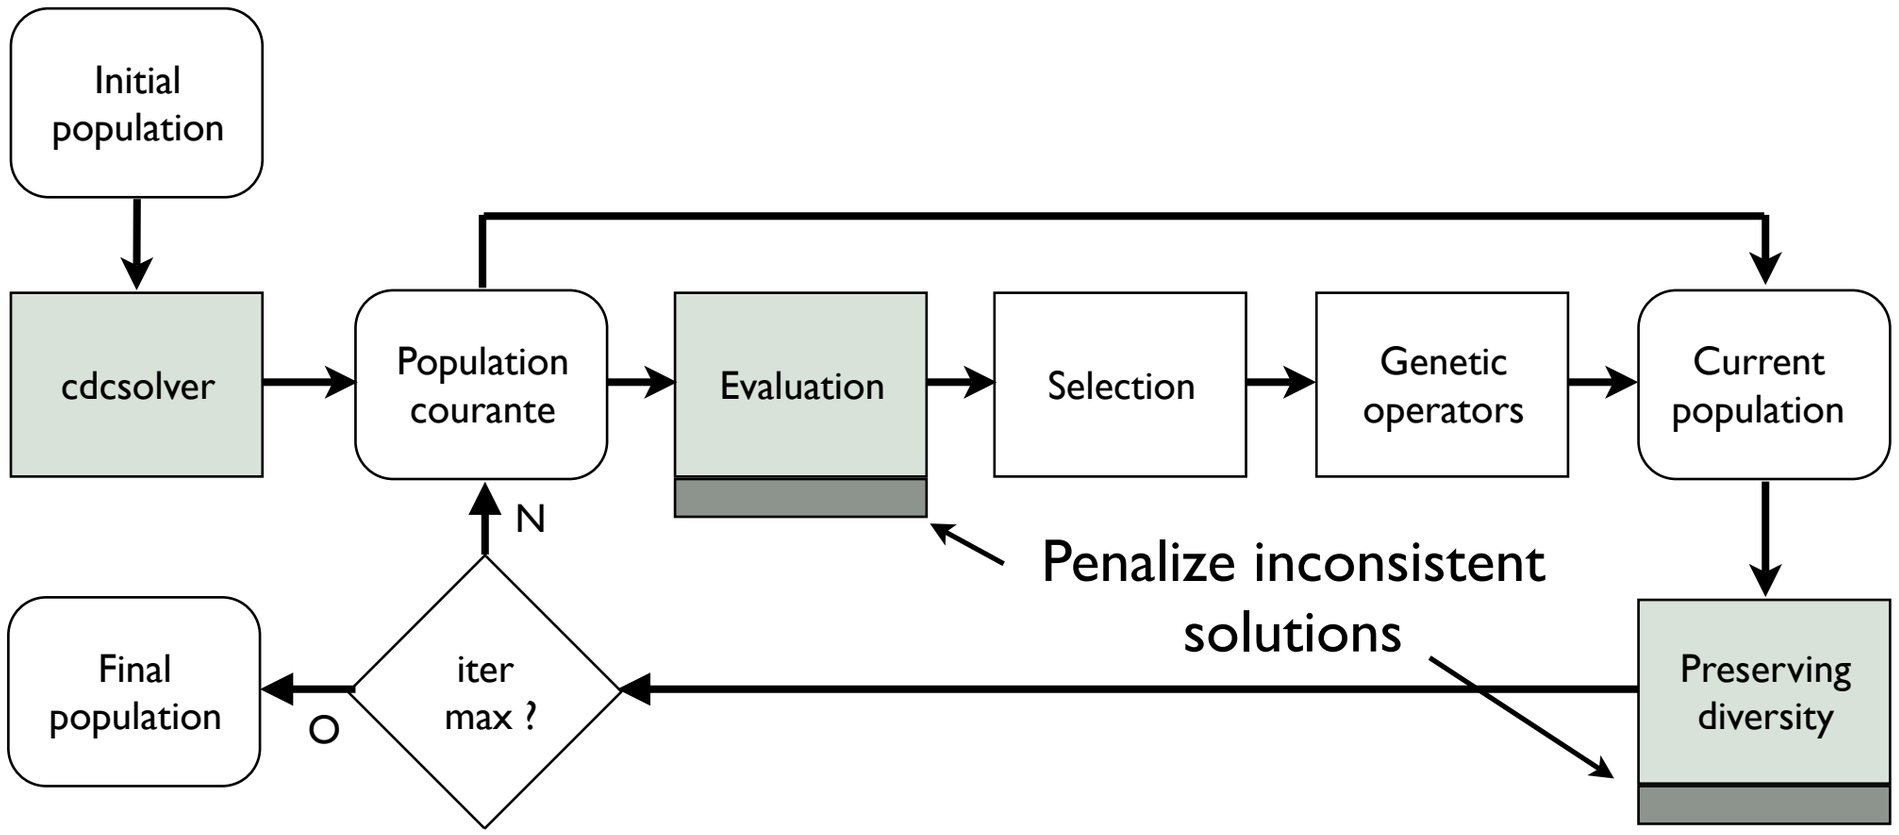
Combining *orchidée* and *cdcsolver*



Combining *orchidée* and *cdcsolver*

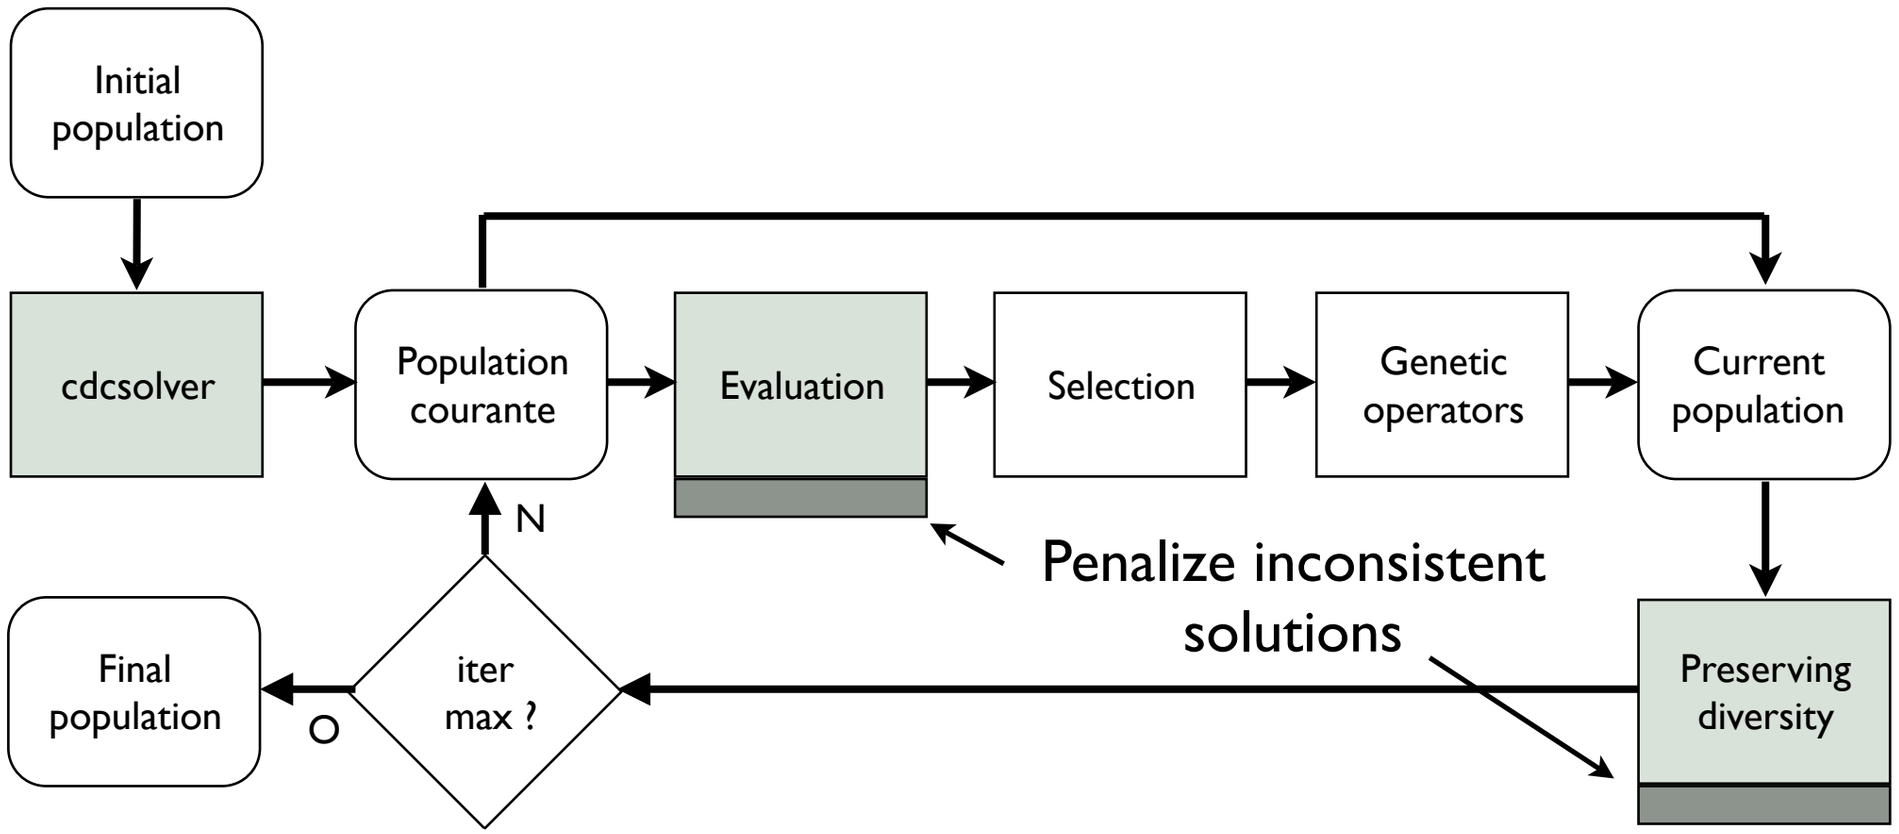


Combining *orchidée* and *cdcsolver*



Configurations comparing rules

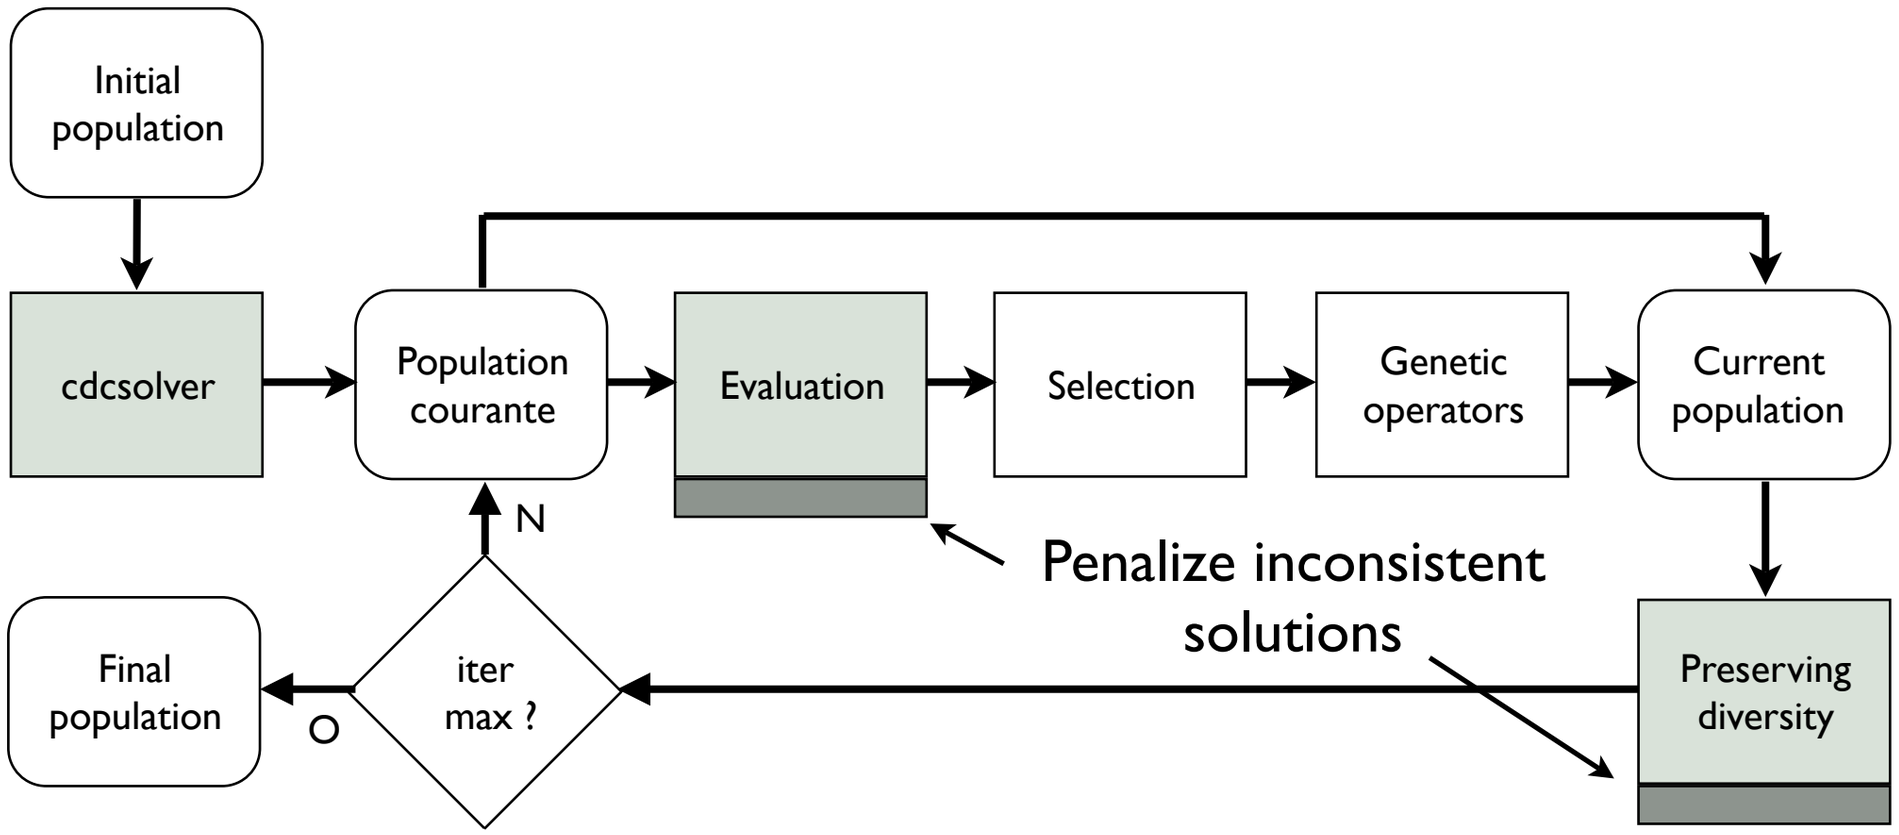
Combining *orchidée* and *cdcsolver*



Configurations comparing rules

1. Choose the more consistent configuration

Combining *orchidée* and *cdcsolver*



Configurations comparing rules

1. Choose the more consistent configuration
2. Choose the configuration with highest fitness according to the current Chebychev norm

Prototype

Prototype

- MATLAB code
- OpenSoundControl (OSC) interface [Wright&al.2003]
- Communicates with OpenMusic and Max/MSP

Prototype

- MATLAB code
- OpenSoundControl (OSC) interface [Wright&al.2003]
- Communicates with OpenMusic and Max/MSP

- Sound target analysis (feature extraction)
- Constrained multiobjective orchestration search
- User interaction - Listening preferences inference mechanism
- Enhancing timbre exploration with multiple views of solution set
- Manual editing / Auto-repairing and auto-transforming procedures

Conclusions

Conclusions

- Multiobjective combinatorial optimization model for the discovery of efficient solutions that approach a timbre target with a combination of instrument sounds

Conclusions

- Multiobjective combinatorial optimization model for the discovery of efficient solutions that approach a timbre target with a combination of instrument sounds
- Local search symbolic constraint solver that addresses compositional context issues

Conclusions

- Multiobjective combinatorial optimization model for the discovery of efficient solutions that approach a timbre target with a combination of instrument sounds
- Local search symbolic constraint solver that addresses compositional context issues
- Collaborative strategy for combining both methods in a single search process that handles potentially conflicting objectives

Conclusions

- Multiobjective combinatorial optimization model for the discovery of efficient solutions that approach a timbre target with a combination of instrument sounds
- Local search symbolic constraint solver that addresses compositional context issues
- Collaborative strategy for combining both methods in a single search process that handles potentially conflicting objectives
- Operational orchestration prototype already used in real-world musical situations

Current limitations

Current limitations

- Instrumental knowledge
